PHP Web 2.0 Mashup Projects: Practical PHP Mashups with Google Maps, Flickr, Amazon, YouTube, MSN Search, Yahoo! Shu-Wai Chow 2007-09-13 Create practical mashups in PHP grabbing and mixing data from Google Maps, Flickr, Amazon, YouTube, MSN Search, Yahoo!, Last.fm, and 411Sync.com Key Features Expand your website and applications using mashups Gain a thorough understanding of mashup fundamentals Clear, detailed walk-

through of the key PHP mashup building technologies Five fully implemented example mashups with full code Book DescriptionA mashup is a web page or application that combines data from two or more external online sources into an integrated experience. This book is your entryway to the world of mashups and Web 2.0. You will create PHP projects that grab data from one place on the Web, mix it up with relevant information from another place on the Web and present it in a single application. This book is made up of five real-world PHP projects. Each project begins with an overview of the technologies and protocols needed for the project, and then dives straight into the tools used and details of creating the project: Look up products on Amazon.Com from their code in the Internet UPC database A fully customized search engine with MSN Search and Yahoo! A personal video jukebox with YouTube and Last.FM Deliver real-time traffic incident data via SMS and the California Highway Patrol! Display pictures sourced from Flickr in Google maps All the mashup applications used in the book are built upon free tools and are thoroughly explained. You will find all the source code used to build the mashups used in this book in the code download section for this book.What you will learn You will learn how to write PHP code to remotely consume services like Google Maps, Flickr, Amazon, YouTube, MSN Search, Yahoo!, Last.fm, and the Internet UPC Database, not to mention the California Highway Patrol Traffic data! You will also learn about the technologies, data formats, and protocols needed to use these web services and APIs, and some of the freely-available PHP tools for working with them. You will understand how these technologies work with each other and see how to use this information, in combination with your imagination, to build your own cutting-edge websites.Chapter 1 provides an overview of "mashups": what a mashup is, and why you would want one.In Chapter 2 we create a basic mashup, and go shopping. We will simply look up products on Amazon.com based on the Universal Product Code (UPC). To do this, we cover two basic web services to get our feet wet ?ç,Ķ,Àù XML-RPC and REST. The Internet UPC Database is an XML-RPC-based service. while Amazon uses REST. We will create code to call

XML-RPC and REST services. Using PHP's SAX function, we create an extensible object-oriented parser for XML. The mashup covered in this chapter integrates information taken from Amazon's e-commerce service (ECS) with the Internet UPC database. In Chapter 3, we create a custom search engine using the technology of MSN, and Yahoo! The chapter starts with an introduction to SOAP, the most complex of the web service protocols. SOAP relies heavily on other standards like WSDL and XSD, which are also covered in readable detail. We take a look at a WSDL document and learn how to figure out what web services are available from it, and what types of data are passed. Using PHP's SoapClient extension, we then interact with SOAP servers to grab data. We then finally create our mashup, which gathers web search results sourced from MSN and Yahoo! For the mashup in Chapter 4, we use the API from the video repository site YouTube, and the XML feeds from social music site Last.fm. We will take a look at three different XML-based file formats from those two sites: XSPF for song playlists, RSS for publishing frequently updated information, and YouTube's custom XML format. We will create a mashup that takes the songs in two Last.fm RSS feeds and queries YouTube to retrieve videos for those songs. Rather than creating our own XML-based parsers to parse the three formats, we have used parsers from PEAR, one for each of the three formats. Using these PEAR packages, we create an object-oriented abstraction of these formats, which can be consumed by our mashup application. In Chapter 5, we screen-scrape from the California Highway Patrol. The CHP maintains a website of traffic incidents. This site auto-refreshes every minute, ensuring the user gets live data about accidents throughout the state of California. This is very valuable if you are in front of a computer. If you are out and about running errands, it would be fairly useless. However, our mashup will use the web service from 411Sync.com to accept SMS messages from mobile users to deliver these traffic incidents to users. We've thrown almost everything into Chapter 6! In this chapter, we use RDF documents SPARQL, RAP, Google Maps, Flickr, AJAX, and JSON. We create a geographically-centric way to present pictures

from Flickr on Google Maps. We see how to read RDF documents and how to extract data from them using SPARQL and RAP for RDF. This gets us the latitude and longitude of London Tube Stations. We display them on a Google Map, and retrieve pictures of a selected station from Flickr. Our application needs to communicate with the API servers for which we use AJAX and JSON, which is emerging as a major data format. The biggest pitfall in this AJAX application is race conditions, and we will learn various techniques to overcome these. Who this book is for If you feel confident with your PHP programming, familiar with the basics of HTML and CSS, unafraid of XML, and interested in mashing things up, this is the book for you! There are a lot of formats and protocols, web services and web APIs encountered in this book if you do not need to know anything about them or about AJAX; you will find all you need in the book.

Object-Oriented PHP Best Practices Ikram Hawramani 2017-03-24 Object-Oriented PHP Best Practices is a book for beginners to object-oriented programming in a PHP environment. Ikram, a web developer who has been building websites since 2001, and his colleagues spent a year rewriting a 450,000-line educational system written in PHP that was an utter and complete mess, the result of a decade of constant changes in programmers in managers, with such wonders as a 2000 line functions doing upwards of 100 database calls to retrieve a student's name, and with band-aids thrown over known issues, and band-aids thrown over these band-aids, until the general accretion of mistakes and bad judgments had led to entire parts of the system being so massively convoluted that no previous programmer had been willing to touch them. As the team refactored the project, Ikram was tasked with taking extensive notes to create a list of conventions that would ease the task of rescuing the project from its tar pit, and more importantly, prevent it from falling back into the pit again as time passed and the project changed hands again. The result was a conventions document that Ikram extended into this book, which summarizes his most important findings. Ikram presents a set of simple yet powerful conventions (sometimes unintuitive) that ensure an object-oriented PHP project stays lean, modular, easy to read and easy to build upon. Most PHP programmers eventually gravitate toward these conventions as they learn painful lessons from past mistakes. This book takes the pain out of the process by identifying these mistakes early and helping you avoid them before you make them.

Extending and Embedding PHP. George Schlossnagle 2006 Over the past three years PHP has evolved from a small niche language to a powerful web development tool. Now in use on over 14 million Web sites, PHP is more stable and extensible than ever. However, there is no

documentation on how to extend PHP; developers seeking to build PHP extensions and increase the performance and functionality of their PHP applications are left to word of mouth and muddling through PHP internals without systematic, helpful guidance. Although the basics of extension writing are fairly easy to grasp, the more advanced features have a tougher learning curve that can be very difficult to overcome. Many developers have complicated PHP applications that cannot be made fat enough in PHP. This is common at any moderate to high-traffic site, forcing the company hire talented, and high-priced, developers to increase performance. With *Extending and Embedding PHP*, Sara Golemon makes writing extensions within the grasp of every PHP developer, while guiding the reader through the tricky internals of PHP.
