**Abiotic Stresses in Field Crops: Response, Impacts and Management under Climate Change Scenario** Aliza Pradhan 2025-01-17 Agriculture is globally challenged by adverse environmental factors, including drought, heat, waterlogging, cold, soil salinity and sodicity, nutrient deficiency, heavy metal contamination, and other edaphic stresses. These stresses impair plant functioning at multiple levels limiting plant development and crop productivity. In the current climate change scenario, the increase in frequency and intensity of these stresses is posing a serious threat to overall food and nutrition security. Plants respond to these stresses through several tolerance mechanisms operating at molecular, biochemical, physiological, or morpho-anatomical levels depending on their developmental stage and type of species. The cope-up strategy also differs depending on abiotic stress type, duration, and intensity. The extent, to which these changes occur to counteract the impact of abiotic stresses as well as the pathways involved in plant acclimation, is not fully understood. An advance in understanding agricultural crops' adaptation and tolerance mechanisms underlying trans-generational effects, epigenetic changes, and stress memory will significantly help in comprehending the implications as well as devising mitigation strategies for sustainable agriculture and, thus, food security. Additionally, it is crucial to understand the interactions and impacts of combined stresses to efficiently advance the development of combined stress-tolerant crops as well as devising mitigation strategies for various climatic stressors.

**Food Industry Wastes** Maria R. Kosseva 2013-01-31 Food Industry Wastes: Assessment and Recuperation of Commodities presents emerging techniques and opportunities for the treatment of food wastes, the reduction of water footprint, and creating sustainable food systems. Written by a team of experts from around the world, this book provides a guide for implementing bioprocessing techniques. It also helps researchers develop new options for the recuperation of these wastes for community benefit. More than 34 million tons of food waste was generated in the United States in 2009, at a cost of approximately \$43 billion. And while less than three percent of that waste was recovered and recycled, there is growing interest and development in recovering and recycling food waste. These processes have the potential not only to reduce greenhouse gases, but to provide energy and resources for other purposes. This book

examines these topics in detail, starting with sources, characterization and composition of food wastes, and development of green production strategies. The book then turns to treatment techniques such as solid-state fermentation and anaerobic digestion of solid food waste for biogas and fertilizer. A deep section on innovative biocatalysts and bioreactors follows, encompassing hydrogen generation and thermophilic aerobic bioprocessing technologies. Rounding out the volume are extensive sections on water footprints, including electricity generation from microbial fuel cells (MFCs), and life cycle assessments. - Food waste is an area of focus for a wide range of related industries from food science to energy and engineering - Outlines the development of green product strategies - International authoring team represents the leading edge in research and development - Highlights leading trends of current research as well as future opportunities for reusing food waste

Functional Nanomaterials and Nanocomposites for Biodegradable Food Packaging Madhusudhan Alle 2025-01-16 This book covers the recent developments in biopolymer nanocomposite materials and their possible impact on the food packaging industry. The food industry has been one of the highest consumers of plastics for the past two decades, where plastics have been used in huge amounts as food packaging materials. The generation of non-biodegradable plastic-based municipal solid waste, especially due to food packaging industry, has now become one of the two paramount problems faced by the world today. The other problem is being the wastage of food in humongous quantities annually. With the onset of globalization, food produced in one part of the world became available to people living in another part. However, during transportation and storage, a plethora of food gets wasted due to microbial contamination of chemical oxidation. This book looks into biopolymer nanocomposites, and it's the ability to address both these issues. It presents the very essence of biopolymer nanocomposite technology with the combination of various nanomaterials and biopolymer to yield a functional product for food packaging, which is demonstrated in the various chapters. In general, this book caters to the needs of students involved in nanotechnology, biotechnology, food technology, industrial chemistry, and many others other interdisciplinary subjects.
