The Electrical Journal 1915

Laboratory Manual of Colloid Chemistry Harry Nicholls Holmes 1928

Distributed Computer Control Systems 1988 M.G. Rodd 1989-04-28

Continuing the forward thinking of previously held distributed computer control systems meetings, this volume discusses both the positive and negative views on trends in OSI-based communications; the development of the fieldbus; the importance of the incorporation into basic real time operating systems to be used for distributed systems of concepts such as time-stamping and access to global time-bases; and the influence of artificial-intelligence-based technologies on the distributed computer control world.

Optimal Designs of Sensor Placement in Water Distribution Systems Shweta Rathi 2025-09-25 The dual purpose of regular monitoring and contaminant event detection in the water distribution systems (WDSs) can be achieved through sensors that can monitor general water quality constituents, such as pH, residual chlorine, conductivity, temperature, etc. This book details different sensor placement parameters considered for contamination detection and regular/routine water quality monitoring in WDSs and their evaluations. It covers genetic algorithm (GA)-based methodology, selecting a specified number of optimal sensor locations using combined weighted objectives. Applications to different pressure-deficient systems and intermittent systems are explained as part of a case study in India. Features: Reviews existing methodologies on the solutions to water contamination and sensor placements in the water distribution systems

(WDSs). Discusses regular water quality monitoring techniques including the methodology and guidelines of water quality monitoring techniques. Includes applications on the methodologies under different cases, such as PDA, considering risk-based sensor placement. Provides illustrative examples with the proposed alternative algorithm both for single- and multi-source networks. Examines applications of the proposed GA-based optimal sensor location modeled to a real-life scenario. This book is aimed at graduate students and researchers in civil engineering, civil and environmental engineering, environmental engineering, hydraulic engineering, water supply/resources engineering, and hydro-informatics.

Water Distribution System Optimization Johannes Gessler 1985 This report describes the development of a computer program WADISO (Water Distribution Systems Optimization) which can be used to optimally size pipes in water distribution systems and select optimal pipes for cleaning and lining. The program can also be used as a steady-state simulation program to calculate flows and pressures in pipe networks. The simulation portion of the program uses the node method with sparse matrix techniques to reduce computations. The optimization portion uses a bounded enumeration technique, based on minimizing the sum of pipe installation, pipe cleaning and lining, and present worth of pumping energy costs. Only discrete commercially available pipe sizes are considered. The program can handle any typical water distribution system and includes pumps, pressure reducing valves, multiple pressure zones, and check valves. To use the optimization, the user must also specify costs as a function of pipe diameter (or use default costs in the program), minimum pressures, up to five water use loadings, a list of which pipes are to be sized, and a range of sizes to be considered. The program user's guide is included as an appendix to the report. Other appendices address how to access the program, how to obtain detailed

documentation, the nature of pipe sizing, existing literature on pipe optimization, and a discussion of the relationship of pipe sizing and water distribution performance criteria. Keywords: Optimization, Pipe flow, Pipe networks, Pipe sizing, Water conveyance, Water distribution.
