Environmental Wind Engineering and Design of Wind Energy

Structures Charalambos Baniotopoulos 2011-12-01 The book presents a state-of-the-art in environmental aerodynamics and the structural design of wind energy support structures, particularly from a modern computational perspective. Examples include real-life applications dealing with pollutant dispersion in the building environment, pedestrian-level winds, comfort levels, relevant legislation and remedial measures. Design methodologies for wind energy structures include reliability assessment and code frameworks.

Diversity and Stability in Aquatic Plant Communities Igor Zelnik 2025-08-08 Aquatic plant communities are crucial components of freshwater ecosystems, often governing the ecological equilibrium and functionality of rivers, streams, and wetlands. They encompass a diverse range of submerged, emergent, and floating plants, supporting the overall balance and resilience of aquatic ecosystems. They play a key role in various ecological and environmental contexts, including ecosystem stability and the global carbon cycle, as well as providing vital habitats for a diverse range of organisms. Several factors shape the aquatic ecosystems, ranging from light, depth, temperature of the water, water flow, and biotic factors, to other external stressors that have over time modified the tolerance and presence of these communities. Further research is required to shed light on the impact of increasing environmental changes and the need for a thorough understanding of how aquatic plant communities respond to such alterations. The main goal of this Research Topic is to examine the complexities of aquatic plant communities and their dynamic interactions with different environmental factors. We aim to explore aquatic plant functional diversity and compare its potential to reveal these interactions. We also hope to investigate interactions between plants and other biological elements, as well as how they cope with biological invasions. Another goal is to examine the diverse responses of wetland vegetation to expected changes in the environmental factors driven by climate change. We encourage scientists to submit their insights into the adaptive strategies of these communities. Ultimately, we hope to enhance our understanding of the ecological roles played by aquatic plants and to encourage effective conservation and management strategies for these vital ecosystems.

EEG/MEG Source Reconstruction Thomas R. Knösche 2022-10-01 This textbook provides a comprehensive and didactic introduction from the basics to the current state of the art in the field of EEG/MEG source reconstruction. Reconstructing the generators or sources of electroencephalographic and magnetoencephalographic (EEG/MEG) signals is an important problem in basic neuroscience as well as clinical research and practice. Over the past few decades, an entire theory, together with a whole collection of algorithms and techniques, has developed. In this textbook, the authors provide a unified perspective on a broad range of EEG/MEG source reconstruction methods, with particular emphasis on their respective assumptions about sources, data,

head tissues, and sensor properties. An introductory chapter highlights the concept of brain imaging and the particular importance of the neuroelectromagnetic inverse problem. This is followed by an in-depth discussion of neural information processing and brain signal generation and an introduction to the practice of data acquisition. Next, the relevant mathematical models for the sources of EEG and MEG are discussed in detail, followed by the neuroelectromagnetic forward problem, that is, the prediction of EEG or MEG signals from those source models, using biophysical descriptions of the head tissues and the sensors. The main part of this textbook is dedicated to the source reconstruction methods. The authors present a theoretical framework of the neuroelectromagnetic inverse problem, centered on Bayes' theorem, which then serves as the basis for a detailed description of a large variety of techniques, including dipole fit methods, distributed source reconstruction, spatial filters, and dynamic source reconstruction methods. The final two chapters address the important topic of assessment, including verification and validation of source reconstruction methods, and their actual application to real-world scientific and clinical questions. This book is intended as basic reading for anybody who is engaged with EEG/MEG source reconstruction, be it as a method developer or as a user, including advanced undergraduate students, PhD students, and postdocs in neuroscience, biomedical engineering, and related fields.

PASCAL. 1994

Handbook of Nanophysics Klaus D. Sattler 2010-09-17 Providing the framework for breakthroughs in nanotechnology, this landmark publication is the first comprehensive reference to cover both fundamental and applied physics at the nanoscale. After discussing the theoretical principles and measurements of nanoscale systems, the organization of the set follows the historical development of nanoscience. Each peer-reviewed chapter presents a didactic treatment of the physics underlying the nanoscale materials, applications, and detailed experimental results. State-of-the-art scientific content is enriched with fundamental equations and illustrations, many in color.
