Charged Particles in Oncology Marco Durante 2018-01-31 High-energy charged particles represent a cutting-edge technique in radiation oncology. Protons and carbon ions are used in several centers all over the world for the treatment of different solid tumors. Typical indications are ocular malignancies, tumors of the base of the skull, hepatocellular carcinomas and various sarcomas. The physical characteristics of the charged particles (Bragg

peak) allow sparing of much more normal tissues than it is possible using conventional X-rays, and for this reason all pediatric tumors are considered eligible for protontherapy. Ions heavier than protons also display special radiobiological characteristics, which make them effective against radioresistant and hypoxic tumors. On the other hand, protons and ions with high charge (Z) and energy (HZE particles) represent a major risk for human space exploration. The main late effect of radiation exposure is cancer induction, and at the moment the dose limits for astronauts are based on cancer mortality risk. The Mars Science Laboratory (MSL) measured the dose on the route to Mars and on the planet's surface, suggesting that a human exploration missions will exceed the radiation risk limits.

Notwithstanding many studies on carcinogenesis induced by protons and heavy ions, the risk uncertainty remains very high. In this research topic we aim at gathering the experiences and opinions of scientists dealing with high-energy charged particles either for cancer treatment or for space radiation protection. Clinical results with protons and heavy ions, as well as research in medical physics and pre-clinical radiobiology are reported. In addition, ground-based and spaceflight studies on the effects of space radiation are included in this book. Particularly relevant for space studies are the clinical results on normal tissue complications and second cancers. The eBook nicely demonstrates that particle therapy in oncology and protection of astronauts from space radiation share many common topics, and can learn from each other. Streamlined procedures unit focuses more sharply on need-to-know content Essentials of Regenerative Medicine in Interventional Pain Management Annu Navani

2024-05-02 Regenerative medicine is an emerging and integral part of interventional pain management and meets definitions of interventional pain management and interventional techniques. Interventional techniques are defined as minimally invasive procedures including, percutaneous precision needle placement, with placement of drugs in targeted areas or ablation of targeted nerves; and some surgical techniques such as laser or endoscopic discectomy, intrathecal infusion pumps, and spinal cord stimulators, for the diagnosis and management of chronic, persistent, or intractable pain. On the same token, interventional pain management is defined as the discipline of medicine devoted to the diagnosis and treatment of pain related disorders principally with the application of interventional techniques in managing subacute, chronic, persistent, and intractable pain, independently or in conjunction with other modalities of treatment. This new edition brings a wide array of information for interventional pain physicians and other physicians practicing regenerative medicine with its applications in managing chronic pain and other disorders. The structure of the book begins with an introduction of the subject, followed by sections on historical context, pathophysiology, applicability of regenerative medicine with its evidence base, anatomy, technical aspects, complications, and precautions for each topic when available and applicable. From across the globe, leading experts in their respective fields contributed chapters on specific topics to present a cogent and integrative understanding of the field of regenerative medicine as applicable for interventional pain physicians. This comprehensive text achieves its goal of providing an evidence-based approach to application of principles of regenerative medicine in managing chronic pain of spinal, neurological, and musculoskeletal origins.
