Intelligent Agent-based Operations Management Sophie D'Amours 2003 Knowledge-based and intelligent agent-based systems can now be applied to operations management. The contributions here demonstrate the range of application of these methods to practical industrial problems. These include the use, in product modeling, of a concurrent engineering approach in new product development, the formalization of knowledge and product information in intelligent systems, and the classification of configuration modeling requirements for industrial product through generic modeling and configuration. In process modeling, information and knowledge management is applied to the building construction industry; while in organization modeling it is applied to the management and control of distributed systems, real-time distributed control systems and scheduling problems. This title will be relevant to business-process reengineering teams, business analysts, quality management teams, continuous improvement analysts, and HR analysts and designers.

Intelligent Components and Instruments for Control Applications 1997 (SICICA '97) L. Foulloy 1997 SICICA'97 was the third symposium in the series (1992, Malaga - Spain; 1994, Budapest - Hungary). It was sponsored by the Technical Committee on Components and Instruments and was organized by the Laboratoire d'Automatique et de MicroInformatique Industrielle, Universiteacute; de Savoie, on behalf of AFCET, the National Member Organization. The symposium was held in the Impeacute;rial Palace Congress Center, Annecy. 178 papers were submitted as draft papers and reviewed by the International Program Committee members who selected 117 papers coming from 25 countries. The topics covered include: the evolution of electronic components, especially mircocontrollers and digital signal processors which can be used for the implementation of instruments where intelligence is located in the processing; problems and solutions using fieldbuses for the control of automated processes; and the principal phases in the industrialisation of microsystems which associate micromechanics and microelectronics. The Symposium showed the vitality of the research in the field of intelligent instruments and components.

Navigating the Evolving Landscape of Safety Standards for Machine Learning-based Road Vehicle Functions Simon Burton 2024-08-26 ML approaches to solving some of the key perception and decision challenges in automated vehicle functions are maturing at an incredible rate. However, the setbacks experienced during initial attempts at widespread deployment have highlighted the need for a careful consideration of safety during the development and deployment of these functions. To better control the risk associated with this storm of complex functionality, open operating environments, and cutting-edge technology, there is a need for industry consensus on best practices for achieving an acceptable level of safety. Navigating the Evolving Landscape of Safety Standards for Machine Learning-based Road Vehicle Functions provides an overview of standards relevant to the safety of ML-based vehicle functions and serves as guidance for technology providers—including those new to the automotive sector—on how to interpret the evolving standardization landscape. The report also contains practical guidance, along with an example from the perspective of a developer of an ML-based perception function on how to interpret the requirements of these standards. Holonic and Multi-Agent Systems for Manufacturing Vladimir Marik 2005-08-29 The challenge faced in today's manufacturing and business environments is the question of how to satisfy increasingly stringent customer requirements while managing growing system complexity. For example, customers expect high-quality, customizable, low-cost products that can be delivered quickly. The systems that deliver these expectations are by nature distributed, concurrent, and stochastic, and, as a result, increasingly difficult to manage. Unfortunately, the traditional hierarchical, strictly centralized approach to control used in these domains is characteristically inflexible, fragile, and difficult to maintain. These shortcomings have led to the development of a new class of manufacturing and supply-chain decision-making approaches in recent years. Solutions based on these approaches usually explore a set of highly distributed decision-making units that are capable of autonomous operations while cooperating interactively to resolve larger problems. The units, referred to as agents in classical computer science and software engineering, or holons if physically integrated with the manufacturing hardware, interact by exchanging information. These units are motivated by arriving at local solutions as well as collaborating and sharing resources and goals in solving the overall problem in question collectively.

Emerging Solutions for Future Manufacturing Systems Luis M. Camarinha-Matos 2006-01-04 Industries and particularly the manufacturing sector have been facing difficult challenges in a context of socio-economic turbulence characterized by complexity as well as the speed of change in causal interconnections in the socio-economic environment. In order to respond to these challenges companies are forced to seek new technological and organizational solutions. In this context two main characteristics emerge as key properties of a modern automation system - agility and distribution. Agility because systems need not only to be flexible in order to adjust to a number of a-priori defined scenarios, but rather must cope with unpredictability. Distribution in the sense that automation and business processes are becoming distributed and supported by collaborative networks. Emerging Solutions for Future Manufacturing Systems includes the papers selected for the BASYS'04 conference, which was held in Vienna, Austria in September 2004 and sponsored by the International Federation for Information Processing (IFIP).

Information Technology for Balanced Manufacturing Systems Weiming Shen 2007-03-07 The manufacturing sector has been facing major challenges as it undergoes revolutionary changes fuelled by new and sophisticated demands from customers, global competition, distribution of manufacturing and marketing activities, and technological advances. In order to address these challenges, manufacturing enterprises need to change the way they do business and adopt innovative technologies and solutions to increase their responsiveness and production efficiency. Information technology plays an essential role in this process. Current manufacturing systems are collections of complex systems or subsystems operating in distributed collaborative environments involving software, hardware, humans, and organizations. It is crucial to keep a balance between the technical aspects of automation and the human and social facets when applying information technology in industrial applications, particularly with the rapid advancements in information and communication technologies and the wide deployment of automated manufacturing systems. However, in order to create appropriate frameworks for exploring the best synergies between humans and automated systems, there are still numerous issues in terms of processes characterization, modeling, and development of adequate support tools. BASYS conferences have been developed and organized to promote the development of balanced automation systems in an attempt to address these issues. The first BASYS conference was successfully launched in Victoria, Brazil (1995), and then the following conferences were held in Lisbon, Portugal (1996), Prague, Czech Republic (1998), Berlin, Germany (2000), Cancun, Mexico (2002), and Vienna, Austria (2004).
