**Parcella '94** C. R. Jesshope 1994 The Parcella series is a forum for displaying the landscape of research in East European countries and is also a meeting place for exchanging ideas and initiating steps towards a future of broad scoped East-West co-operation in a unified Europe. Advanced supercomputing and the obtained software technology are of great importance for the East-West technological co-operation. It includes applications like energy and raw material resources planning and exploration modelling, material research (special metals, ceramics, semiconductors) and industrial supercomputing. These proceedings contain several recent research results on the topics of mathematical foundations of parallel computing, languages, programming, theory of algorithms, data flow, design of architectures and systems, memory and memory access, interconnection networks, routing, image processing

and modelling, computational geometry, computer graphics, graph algorithms, fault-tolerant computing, neurocomputing and connectionism, optical computing, scientific computation, applications in biology, physics, engineering, manufacturing systems, program packages and problem solving environments supporting scientific computations.

## **Automated DNA Sequencing and Analysis** Mark D. Adams

1994-06-29 A timely book for DNA researchers, *Automated DNA Sequencing and Analysis* reviews and assesses the state of the art of automated DNA sequence analysis—from the construction of clone libraries to the development of laboratory and community databases. It presents the methodologies and strategies of automated DNA sequence analysis in a way that allows them to be compared and contrasted. By taking a broad view of the process of automated sequence analysis, the present volume bridges the gap between the protocols supplied with instrument and reaction kits and the finalized data presented in the research literature. It will be an invaluable aid to both small laboratories that are interested in taking maximum advantage of automated sequence resources and to groups pursuing large-scale cDNA and genomic sequencing projects. The field of automation in DNA sequencing and analysis is rapidly moving, this book fulfills those needs, reviews the history of the art and provides pointers to future development.

Computer Science & Perl Programming Jon Orwant 2002-11-04 In its first five years of existence, The Perl Journal ran 247 articles by over 120 authors. Every serious Perl programmer subscribed to it, and every notable Perl guru jumped at the opportunity to write for it. TPJ explained critical topics such as regular expressions, databases, and object-oriented programming, and demonstrated Perl's utility for fields as

diverse as astronomy, biology, economics, AI, and games. The magazine gave birth to both the Obfuscated Perl Contest and the Perl Poetry contest, and remains a proud and timeless achievement of Perl during one of its most exciting periods of development. Computer Science and Perl Programming is the first volume of The Best of the Perl Journal, compiled and re-edited by the original editor and publisher of The Perl Journal, Jon Orwant. In this series, we've taken the very best (and still relevant) articles published in TPJ over its 5 years of publication and immortalized them into three volumes. This volume has 70 articles devoted to hard-core computer science, advanced programming techniques, and the underlying mechanics of Perl. Here's a sample of what you'll find inside: Jeffrey Friedl on Understanding Regexpes Mark Jason Dominus on optimizing your Perl programs with Memoization Damian Conway on Parsing Tim Meadowcroft on integrating Perl with Microsoft Office Larry Wall on the culture of Perl Written by 41 of the most prominent and prolific members of the closely-knit Perl community, this anthology does what no other book can, giving unique insight into the real-life applications and powerful techniques made possible by Perl. Other books tell you how to use Perl, but this book goes far beyond that: it shows you not only how to use Perl, but what you could use Perl for. This is more than just The Best of the Perl Journal -- in many ways, this is the best of Perl.

**Introduction to Computer Systems** John A. Aseltine 1989-10-02 The objective of this text is to provide a basis for the development of computer understanding, as needed for further study in information systems and related areas. It is directed principally toward individuals who have not had formal exposure to computer understanding which is now characteristic of undergraduate education in computer science, electrical engineering, or systems engineering.

**Semiconductor Devices** Kevin M. Kramer 1997 CD-ROM contains: "Win32 version of SGFramework and the simulations contains in the book."

*Design of Modern Communication Networks* Christofer Larsson

2014-03-05 *Design of Modern Communication Networks* focuses on methods and algorithms related to the design of communication networks, using optimization, graph theory, probability theory and simulation techniques. The book discusses the nature and complexity of the network design process, then introduces theoretical concepts, problems and solutions. It demonstrates the design of network topology and traditional loss networks, followed by uncontrolled packet networks, flow-controlled networks, and multiservice networks. Access network design is reviewed, and the book concludes by considering the design of survivable (reliable) networks and various reliability concepts. - A toolbox of algorithms: The book provides practical advice on implementing algorithms, including the programming aspects of combinatorial algorithms. - Extensive solved problems and illustrations: Wherever possible, different solution methods are applied to the same examples to compare performance and verify precision and applicability. - Technology-independent: Solutions are applicable to a wide range of network design problems without relying on particular technologies. *LEDA* Kurt Mehlhorn 1999-11-11 *LEDA* is a library of efficient data types and algorithms and a platform for combinatorial and geometric computing on which application programs can be built. In each of the core computer science areas of data structures, graph and network algorithms, and computational geometry, *LEDA* covers all (and more) that is found in the standard textbooks. *LEDA* is the first such library; it is written in C++ and is available on many types of machine. Whilst the software is freely available worldwide and is installed at hundreds of sites, this is the first book devoted to the library. Written by the main authors of *LEDA*, it is the definitive account, describing how the system is constructed and operates and how it can be used. The authors supply ample examples from a range of areas to show how the library can be used in practice, making the book essential for all workers in algorithms, data structures and computational geometry.
