Biological Physics Student Edition: Energy, Information, Life Philip

Nelson 2020-05-21 Award-winning professor brings you from first-year physics and chemistry to the frontier of single-molecule biophysics. Biological Physics is a university textbook that focuses on results in molecular motors, self-assembly, and single-molecule manipulation that have revolutionized the field in recent years, and integrates these topics with classic results in statistical physics, biophysical chemistry, and neuroscience. The text also provides foundational material for the emerging fields of nanotechnology and mechanobiology, and has significant overlap with the revised MCAT exam. This inexpensive new edition updates the classic book, particularly the chapter on motors, and incorporates many clarifications and enhancements throughout. Exercises are given at all levels of difficulty. Instead of offering a huge pile of facts, the discovery-style exposition frequently asks the reader to reflect on "How could anything like that happen at all?" and then shows how science, and scientists, have proceeded incrementally to peel back the layers of mystery surrounding these beautiful mechanisms. Working through this book will give you an appreciation for how science has advanced in the past, and the skills and frameworks needed to push forward in the future. Additional topics include the statistical physics of diffusion; bacterial motility; self-assembly; entropic forces; enzyme kinetics; ion channels and pumps; the chemiosmotic mechanism and its role in ATP maintenance; and the discovery of the mechanism of neural signaling.

Statistical Mechanics in Physics and Biology: Volume 463 Denis Wirtz

1997 Since statistical physics is a tool for the study not only of disordered physical systems, but of biological systems as well, this book from MRS focuses on both. While including physical problems such as fractals, pattern formation at first-order phase transitions, and glassy dynamics, the book also focuses on problems such as the statistical mechanics of DNA and DNA replications, structuring in biological systems, and problems in 'biologically inspired physics'. Topics include: statistical mechanics of proteins; statistical mechanics of DNA; biologically inspired physics; statistical mechanics in biology; micromanipulation in physics and biology; friction and fracture; statistical mechanics in physics and granular media.

DNA Nanoscience Kenneth Douglas 2016-10-14 DNA Nanoscience:

From Prebiotic Origins to Emerging Nanotechnology melds two tales of DNA. One is a look at the first 35 years of DNA nanotechnology to better appreciate what lies ahead in this emerging field. The other story looks back 4 billion years to the possible origins of DNA which are shrouded in mystery. The book is divided into three parts comprised of 15 chapters and two Brief Interludes. Part I includes subjects underpinning the book such as a primer on DNA, the broader discipline of nanoscience, and experimental tools used by the principals in the narrative. Part II examines the field of structural DNA nanotechnology, founded by biochemist/crystallographer Nadrian Seeman, that uses DNA as a construction material for nanoscale structures and devices, rather than as a genetic material. Part III looks at the work of physicists Noel Clark and Tommaso Bellini who found that short DNA (nanoDNA) forms liquid crystals that act as a structural gatekeeper, orchestrating a series of self-assembly processes using nanoDNA. This led to an explanation of the polymeric structure of DNA and of how life may have emerged from the prebiotic clutter.

Bridging Complexity and Post-Structuralism Minka Woermann

2016-09-27 This work addresses the topic of philosophical complexity, which shares certain assumptions with scientific complexity, cybernetics, and General Systems Theory, but which is also developing as a subject field in its own right. Specifically, the post-structural reading of philosophical complexity that was pioneered by Paul Cilliers is further developed in this study. To this end, the ideas of a number of contemporary French post-structural theorists and their predecessors - including Derrida, Nancy, Bataille, Levinas, Foucault, Saussure, Nietzsche, Heidegger, and Hegel - are introduced. The implications that their various insights hold for our understanding of complex human systems are teased out at the hand of the themes of economy, (social) ontology, subjectivity, epistemology, and ethics. The analyses are also illuminated at the hand of the problematic of the foreigner and the related challenges of showing hospitality to foreigners. The study presents a sophisticated account of both philosophical complexity and philosophies of difference. By relating these subject fields, the study also extends our understanding of philosophical complexity, and offers an original characterisation of the aforementioned philosophers as complex thinkers.
