Timber Structures: Design methods 1997

This standard sets out limit state design methods for the structural use of timber which are based on the principles of structural mechanics and on data established by research. The Standard is intended for use in the design or appraisal of structural elements or systems comprised of timber or wood products and of structures comprised substantially of timber. To this end, it provides design data for sawn timber, laminated timber, timber in pole form, plywood, laminated veneer lumber and various types of fastenings. In addition, it provides methods of test for

components or assemblies of unconventional design which may not be readily amenable to detailed analysis.

The Design of Timber Flooring for Domestic Construction Joseph J. Mack 1978 Empirical formulae have been derived from laboratory tests for the deflection of tongued and grooved timber flooring under a concentrated load. An empirical formula has also been derived for the concentrated load puncture strength of tongued and grooved timber flooring. A method using these formulae has been developed for the design of domestic flooring to satisfy strength and stiffness criteria.

The Development of Reliability Based Durability Design Methods for Timber Structures Geoff Stringer 1993 Durability design methods used in Australia are generally uncoordinated and do not meet the changing

needs of durability engineers. Durability design principles, environmental agents and the existing methods are summarised. An alternative method is proposed to allow engineers to reliably estimate the effect of environmental agents on the strength and stiffness of timber members and joints. A Durability Coordinators Group is recommended to facilitate further debate.

Trends in Timber Engineering Research Robert Hocquard Leicester 1982 This paper presents an overview of trends in timber engineering research, with an emphasis on topics of particular significance to Australia. An historical survey of this research indicates that it can be classified into well-defined eras, each concerned with a particular type of research. Detailed discussion is given on the current era of research, one concerned largely with research in the laboratory; and on the next research era, one that will probably be dominated by research into the effects of human factors on the building

industry. A few prognostications on the characteristics of long-term research trends are also given.

The Grouping of Species for the Design of Timber Joints with Particular Application to Nailed Joints J. J. Mack 1978 The system used in Australia of grouping timber species for the purposes of the design of joints made with mechanical fasteners has been examined. It is proposed that the present system, which is largely based on density, be continued, but with some changes to the group limits. The relation between nailed joint strength properties and density has been studied for a large number of species, and group limits for these properties have been derived from the strength density regressions.
