The Appendicular Skeleton The Open The Open Courses Library 2019-10-28 The Appendicular Skeleton Anatomy Your skeleton provides the internal supporting structure of the body. The adult axial skeleton consists of 80 bones that form the head and body trunk. Attached to this are the limbs, whose 126 bones constitute the appendicular skeleton. These bones are divided into two groups: the bones that are located within the limbs themselves, and the girdle bones that attach the limbs to the axial skeleton. The bones of the shoulder region form the pectoral girdle, which anchors the upper limb to the thoracic cage of the axial skeleton. The lower limb is attached to the vertebral column by the pelvic girdle. Because of our upright stance, different functional demands are placed

upon the upper and lower limbs. Thus, the bones of the lower limbs are adapted for weight-bearing support and stability, as well as for body locomotion via walking or running. In contrast, our upper limbs are not required for these functions. Instead, our upper limbs are highly mobile and can be utilized for a wide variety of activities. The large range of upper limb movements, coupled with the ability to easily manipulate objects with our hands and opposable thumbs, has allowed humans to construct the modern world in which we live. Chapter Outline: The Pectoral Girdle Bones of the Upper Limb The Pelvic Girdle and Pelvis Bones of the Lower Limb Development of the Appendicular Skeleton The Open Courses Library introduces you to the best Open Source Courses.
