which means that it is easier to understand than other programming languages. It was designed primarily so that software developers could just code their programs once, and allow those programs run anywhere, or at least, in most platforms, as long as those platforms allow Java code to run in them. Java primarily uses some of the same elements that C+ and C++ use, but transforms them into much simple, easy to understand versions that could also be modified depending on the developer's preferences. Java has also been created to run with enough runtime support, both for hardware and software, by means of representing each bytecode in a clear, and concise manner. For example, shih tzus, border collies, and terriers are all dogs-therefore, they could all be classified as dogs, and thus, not a lot of space would be taken up in the system, and the system would be able to work in a fast manner.
