Atmospheric and Space Flight Dynamics Ashish Tewari

2007-05-08 This book offers a unified presentation that does not discriminate between atmospheric and space flight. It demonstrates that the two disciplines have evolved from the same set of physical principles and introduces a broad range of critical concepts in an accessible, yet mathematically rigorous presentation. The book presents many MATLAB and Simulink-based numerical examples and real-world simulations. Replete with illustrations, end-of-chapter exercises, and selected solutions, the work is primarily useful as a textbook for advanced undergraduate and beginning graduate-level students.

Three-dimensional Alpha Shapes Herbert Edelsbrunner

1992 Abstract: "Frequently, the data produced in scientific computing applications is in its abstract form a finite point set in space, and it is sometimes useful or required to compute what one might call the 'shape' of the set. For that purpose this paper introduces the formal notion of the family of α -shapes of a finite point set in space. An algorithm is presented that constructs the family of a set of size n in worst-case time $O(n^2)$. A robust implementation of the algorithm is discussed and several applications in the area of scientific computing are mentioned."

High-performance Computer Architecture

Harold S. Stone 1993 This update of the popular book on computer architecture presents design ideas embodied in many high-performance machines and stresses techniques for evaluating them. Stone develops a proper understanding of the design

process by treating the various trade-offs that exist in designing choices, and shows how good designs make efficient use of technology. Features Teaches techniques for the design and analysis of high-performance machines Develops students' intuition for design by treating various tradeoffs that exist in design choices Discusses many important topics: RISC architectures, interconnection meshes, Cache coherent and multiprocessors, and Cache Memory. Includes enhanced descriptions of RISC Processors Expands material on Cache Memory Analysis Current technology in RISC with a focused look on super scalar Additional memory models and techniques for doing Cache design New proposals for coherent memory systems in System C parallel processors Both design and thought problems and problems with limiting parameters are provided 0201526883B04062001 Quarterly progress and status report Kungl. högskolan. Speech Transmission Laboratory 1993 Theoretical Ecology Ryan Chisholm 2025-09-09 An accessible and wide-ranging introduction to the concepts and tools of theoretical ecology Theoretical ecology explores the mechanisms that structure ecological communities using a variety of mathematical and computational tools. Theoretical Ecology shows you how to translate ecological problems into mechanistic models using both mathematics and the programming language R. The book teaches key concepts and core quantitative skills while also devoting significant attention to the reasons for building mathematical ecological models. Why do species populations fluctuate over time and space? How do multiple species coexist? What forces drive nutrient and carbon cycles? Does higher species diversity lead to higher biomass? Each chapter in this incisive and informative book is motivated by questions like these, and every chapter

includes boxes that delve into mathematical details and provide coding examples in R. Focuses on mathematical and computational methods while also drawing on conceptual and graphical approaches, and explores how the various approaches complement one another Teaches students the skills they need to implement and analyze ecological models in R Covers topics ranging from single-species, competition, and predator-prey models to community ecology, island biogeography, and nutrient-flux models Provides exercises of graduated difficulty at the end of every chapter Ideal for advanced undergraduate and graduate classrooms and for independent study Includes a road map for class planning and self-study

Modeling Power Electronics and Interfacing Energy Conversion Systems

M. Godoy Simoes 2016-09-16

Discusses the application of mathematical and engineering tools for modeling, simulation and control oriented for energy systems, power electronics and renewable energy This book builds on the background knowledge of electrical circuits, control of dc/dc converters and inverters, energy conversion and power electronics. The book shows readers how to apply computational methods for multi-domain simulation of energy systems and power electronics engineering problems. Each chapter has a brief introduction on the theoretical background, a description of the problems to be solved, and objectives to be achieved. Block diagrams, electrical circuits, mathematical analysis or computer code are covered. Each chapter concludes with discussions on what should be

Robotics, Vision and Control

Peter Corke 2011-09-05

The author has maintained two

open-source MATLAB

Toolboxes for more than 10

years: one for robotics and one

for vision. The key strength of

the Toolboxes provide a set of

tools that allow the user to

work with real problems, not

trivial examples. For the

student the book makes the

algorithms accessible, the

Toolbox code can be read to

gain understanding, and the

examples illustrate how it can

be used —instant gratification

in just a couple of lines of

MATLAB code. The code can

also be the starting point for

new work, for researchers or

students, by writing programs

based on Toolbox functions, or

modifying the Toolbox code

itself. The purpose of this book

is to expand on the tutorial

material provided with the toolboxes, add many more examples, and to weave this into a narrative that covers robotics and computer vision separately and together. The author shows how complex problems can be decomposed and solved using just a few simple lines of code, and hopefully to inspire up and coming researchers. The topics covered are guided by the real problems observed over many years as a practitioner of both robotics and computer vision. It is written in a light but informative style, it is easy to read and absorb, and includes a lot of Matlab examples and figures. The book is a real walk through the fundamentals of robot kinematics, dynamics and joint level control, then camera models, image processing, feature extraction and epipolar geometry, and bring it all together in a visual servo system.
