Newnes Building Services Pocket Book Andrew Prentice 2012-05-31 Newnes Building Services Pocket Book is a unique compendium of essential data, techniques and procedures, best practice, and underpinning knowledge. This makes it an essential tool for engineers involved in the design and day-to-day running of mechanical services in buildings, and a valuable reference for managers, students and engineers in related fields. This pocket reference gives the reader access to the knowledge and knowhow of the team of professional engineers who wrote the sixteen chapters that cover all aspects of mechanical building services. Topic coverage includes heating systems, ventilation, air conditioning, refrigeration, fans, ductwork, pipework and plumbing, drainage, and fire protection. The result is a comprehensive guide covering the selection of HVAC systems, and the design process from initial drafts through to implementation. The second edition builds on the success of this popular guide with references to UK and EU legislation fully updated throughout, and coverage fully in line with the latest CIBSE guides.

Heating Systems, Plant and Control Antony R. Day 2008-04-15 In many climates buildings are unable to provide comfort conditions for year-round occupancy without the benefit of a heating system, and most HVAC engineers will routinely be involved with issues concerning the design, installation and performance of such systems. Furthermore, in temperate climates, heating of buildings accounts for a large slice of annual carbon emissions. The design of heating systems for maximum efficiency and minimum carbon emission is therefore now a matter of prime concern to all HVAC engineers. The book provides an up-to-date review of the design, engineering and control of modern heating systems. Part A deals with heat generating plant. While this concentrates on conventional and condensing boilers, small-scale combined heat and power systems and heat pumps are also discussed. Part B deals with heat emitters, pipe circuits and variable-speed pumping, hot water service, optimum plant size and the vital issues of plant and system control, including sequence control of multiple boilers. Techniques for managing the energy use and running costs of heating systems are also discussed. The authors have brought together over a half-century of combined experience covering all aspects of the building services Industry to provide an up-to-date and comprehensive text that is both technically rigorous yet highly practical. This makes the book equally relevant to the busy HVAC engineer looking for a handy practical reference, the student looking to build on their basic knowledge or the researcher interested in key issues of heating system design and performance.

Energy Management and Operating Costs in Buildings Keith Moss 2013-06-17 Managing the consumption and conservation of energy in buildings must now become the concern of both building managers and occupants. The provision of lighting, hot water supply, communications, cooking, space heating and cooling accounts for 45 per cent of UK energy consumption. Energy Management and Operating Costs in Buildings introduces the reader to the principles of managing and conserving energy consumption in buildings people

use for work or leisure. Energy consumption is considered for the provision of space heating, hot water, supply ventilation and air conditioning. The author introduces the use of standard performance indicators and energy consumption yardsticks, and discusses the use and application of degree days.

Air Conditioning Systems Roger Colby Legg 1991 The efficient use of energy resources - both for economic and environmental reasons - will remain a top priority for the foreseeable future. Roger Legg's comprehensive treatment of air conditioning systems is devoted to ensuring that, when installed, they not only meet their design criteria but maximize energy efficiency.

Window Design Chartered Institution of Building Services Engineers 1987 This document is a revision and expansion of Technical Report No. Daytime Lighting in Buildings. The original document was published in 1962 by the Illuminating Engineering Society. A revision was published in 1972. Since then attitudes towards the lighting of buildings have changed. Some of the reasons for this are the considerable increase in the cost of energy and the recognition of the need to use it efficiently; in the commercial sector particularly the use of computers has resulted in different approaches to the use of space within buildings. The earlier document concerned itself mainly with design for daylight. This new document, while sharing this concern, brings together in greater detail than before the other design factors which are influenced by daylight design decisions. It is all too easy to design windows to provide daylight, and at the same time create problems of unwanted noise intrusion, glare, summertime overheating and energy waste. This guide provides designers with a means of identifying the important factors and a method of solving some of the design problems which will inevitably arise. The reader's attention is drawn to the fact that in applying data and ideas from the different sections of the guide there will inevitably be a need to retain a balance between often conflicting requirements. This document is intended to supplement the current range of CIBSE documentation and there is ample cross referencing. The guide is divided into Part A: Design sequence and Part B: Design information. The reference numbers throughout Part A and the supplementary numbers within the sectional reference lists in Part B refer to the Classified Bibliography on page 64. Part A guides the designer through the various stages of design and indicates the interaction between daylighting considerations and others. It is cross referenced to Part B which provides more detailed guidance on prediction methods and basic data along with references to the relevant CIBSE publications. The design information section is longer than the design sequence which it supports. This is inevitable when alternative evaluation and prediction methods are provided. It is not envisaged that a designer would ever work step-by-step through the whole design sequence. For this reason Part A is set out in a three-column format to enable the reader more easily to locate the particular material which interests him from the left-hand column, to read the relevant text in the centre column and to pick up the references from the right-hand column. Many aspects of window design may legitimately be based on experience or intuition rather than on formal analysis--for example the use of splayed reveals, the position of glazing bars and the use of the colour. The role of the design sequence is to prompt the designer when he reaches an impasse, and to offer a rational basis for decision making whenever necessary. This publication refers to the design of conventional windows in the United Kingdom, though it may also apply to other localities with a similar climate. Some of the procedures presented are relatively new; for example, the concept of average daylight factor. Although values of average daylight factor have been recommended, it should be noted that experience of what the precise values imply in terms of daylight quality and quantity is limited, and the recommendations may be changed in the light of experience. On a similar note, some of the techniques presented for designing conventional windows may not be totally reliable when applied to atrium design. Therefore caution is urged when applying the content of the guide to anything other than conventional fenestration. In this content 'window' covers vertical glazing in walls and glazing in sloping environments such as roofs. Some aspects of window design are beyond the scope of this guide, such as constructional methods, or problems of strength or weather tightness. Guidance on these aspects can be obtained from the window manufacturers.

Plant Engineer's Reference Book Dennis A. Snow 1991 * Useful to engineers in any industry * Extensive references provided throughout * Comprehensive range of topics covered * Written with practical situations in mind A plant engineer is responsible for a wide range of industrial activities, and may work in any industry. The breadth of knowledge required by such professionals is so wide that previous books addressing plant engineering have either been limited to certain subjects or cursory in their treatment of topics. The Plant Engineer's Reference Book is the first volume to offer complete coverage of subjects of interest to the plant engineer. This reference work provides a primary source of information for the plant engineer. Subjects include selection of a suitable site for a factory and provision of basic facilities (including boilers, electrical systems, water, HVAC systems, pumping systems and floors and finishes). Detailed chapters deal with basic issues such as lubrication, corrosion, energy conservation, maintenance and materials handling as well as environmental considerations, insurance matters and financial concerns. The authors chosen to contribute to the book are experts in their various fields. The Editor has experience of a wide range of operations in the UK, other European countries, the USA, and elsewhere in the world. Produced with the backing of the Institution of Plant Engineers, this work is the primary source of information for plant engineers in any industry worldwide.

Air Conditioning Application and Design W.P. Jones 2012-11-12 Intended for advanced students of building services, this practical book describes the design of air conditioning systems. Readers are assumed to have a knowledge of the basic principles of air conditioning, which are covered in the companion volume Air Conditioning Engineering. This new edition takes account of the latest building codes and pays greater attention to energy conservation. The section on systems characteristics is expanded and extensively revised to take account of developments in the technology of air conditioning since publication of the previous edition. There are expanded sections on specialist applications such as systems for clean rooms in the semiconductor industry. The author has wide experience both in lecturing on the subject and in the practical design and installation of air conditioning systems.
