After Ice Rafico Ruiz 2024-11-01 As the climate warms and the hydrological cycle falters, ice is no longer a reliable feature of higher latitudes or winter seasons. What are the consequences of the planet's waning capacity to cool? In other words, what comes after ice? This collection examines the implications of the end of consistent freezing and thawing cycles. After Ice gathers experts in a wide range of disciplines to articulate aspects of the cold humanities. They investigate ice and its dynamic properties as a foundational element of Indigenous communities in the Arctic regions, as a commodity with technological and political value, and as a reflection of environmental change and the passage of time. As the future of the cryosphere is increasingly determined by human behaviour, this thought-provoking exploration envisions ice as both a phase of water and as a milieu for sensemaking. It asks us to consider how to define, describe, and materially characterize our warming world.

Understanding the Indian Ocean T. S. S. Rao 1998 Marking the thirtieth anniversary of the end of the International Indian Ocean Expedition, this book offers the reader a fascinating view of past lore and the present state of oceanographic knowledge of the Indian Ocean and suggests future directions for its study and monitoring.

Regional Geography of the United States and Canada Daniel R. Montello 2021-03-29 The fifth and thoroughly revised edition of *Regional Geography of the United States and Canada* provides a rich and comprehensive overview of both the physical and human geography of these two countries, and in the true spirit of geography, the interactions and interrelations of the physical and human. Following long traditions of the discipline of geography, this text incorporates words, maps, drawings, photographs, and numerical data to present its information in an engaging way. After covering beneficial precursor topics—such as the basics of physical and human geography—the text explores fifteen regions of the US and Canada. The authors observe and describe our planet's geography in thorough and accessible detail, while laying out the spatial basics of the location, shape, and size of the different regions, and summarizes their most distinctive thematic qualities. Physical topics covered include the region's topography and landforms, soils, climate, hydrography, vegetation, and wildlife. The human topics include the region's population; the ethnicities and settlement history of its people; economic activities, including agriculture, forestry, mining, fishing, manufacturing, and service industries; cities; and transportation. In-depth essays expand on specific topics of interest and importance, while outlook sections prognosticate about the near future of the regions. Each chapter concludes with a bibliography of books, articles, and reports that provide further sources for the interested reader.

Paleoclimatology Gilles Ramstein 2020-11-09 This two-volume book provides a comprehensive, detailed understanding of paleoclimatology beginning by describing the "proxy data" from which quantitative climate parameters are reconstructed and finally by developing a comprehensive Earth system model able to simulate past climates of the Earth. It compiles contributions from specialists in each field who each have an in-depth knowledge of their particular area of expertise. The first volume is devoted to "Finding, dating and interpreting the evidence". It describes the different geo-chronological technical methods used in paleoclimatology. Different fields of geosciences such as: stratigraphy, magnetism, dendrochronology, sedimentology, are drawn from and proxy reconstructions from ice sheets, terrestrial (speleothems, lakes, and vegetation) and oceanic data, are used to reconstruct the ancient climates of the Earth. The second volume, entitled "Investigation into ancient climates," focuses on building comprehensive models of past climate evolution. The chapters are based on understanding the processes driving the evolution of each component of the Earth system (atmosphere, ocean, ice). This volume provides both an analytical understanding of each component using a hierarchy of models (from conceptual to very sophisticated 3D general circulation models) and a synthetic approach incorporating all of these components to explore the evolution of the Earth as a global system. As a whole this book provides

the reader with a complete view of data reconstruction and modeling of the climate of the Earth from deep time to present day with even an excursion to include impacts on future climate.

Cryospheric Systems Geological Society of London 2005 The introduction of the term periglacial by Lozinski in 1909 to describe the cold-climate conditions in the zone adjacent to, but beyond, the Pleistocene glaciers encouraged the separate development of geocryological and glaciological research. Geological and geomorphological processes at the interface between glaciers and permafrost have, as a result, been given less attention than they warrant, and the influence of one on the other has in many respects been neglected. This book includes a collection of papers that emphasize glacier-permafrost interactions. Papers consider permafrost and its influence on glacial tectonic processes, glacial meltwater systems and ground-ice development in proglacial and ice-marginal environments. In addition, recent research findings are reported on paraglacial processes, permafrost evolution, rock glaciers, the formation of ice-wedge casts and periglacial slope evolution. It is hoped that this book will stimulate interest in the interface between glacial and periglacial systems, and encourage further collaborative research involving glaciologists and glacial geologists on the one hand, and geocryologists and permafrost scientists on the other.

Spectral Futures Bernd Herzogenrath 2025-12-11 What colour is the future - or rather, what colors are the futures? Broad and enlightening in

its coverage, this collection explores the notion that there is not just one visualization of the future, but many, stretching across and beyond shades of utopian brightness and dystopian darks. Visiting futures that belong to the realm of ghosts, it calls for a hauntology that deals not only with spectres of the past but also the of future, offering a fascinating engagement with both colonial history and hyper-accelerated societies. Guided by a diversity of colours, contributors speculate on non-anthropogenic futurities, theorising on the richness of an essentially complex and disordered material universe. The volume's critical approaches range from speculative realism, oceanic biology, and philosophy and politics, to posthumanism and queer theory. What all these offerings have in common is a strong focus on materiality, the in|human, and the innovative possibilities that are brought into light by this 'fabulated spectrum'. They combine the potentialities of philosophy, art, and science, in that they all forge a relation to chaos, or, an undeterminable 'new.' Powerful and thought-provoking, this book illuminates different possibilities of gazing upon futures in nuanced and novel ways.

Geocryology Stuart A. Harris 2017-09-28 This book provides a general survey of Geocryology, which is the study of frozen ground called permafrost. Frozen ground is the product of cold climates as well as a variety of environmental factors. Its major characteristic is the accumulation of large quantities of ice which may exceed 90% by volume. Soil water changing to ice results in ground heaving, while thawing of this ice produces ground subsidence often accompanied by soil flowage. Permafrost is very susceptible to changes in weather and climate as well as to changes in the microenvironment. Cold weather produces contraction of the ground, resulting in cracking of the soil as well as breakup of concrete, rock, etc. Thus permafrost regions have unique landforms and processes not found in warmer lands. The book is divided into three parts. Part 1 provides an introduction to the characteristics of permafrost. Four chapters deal with its definition and characteristics, the unique processes operating there, the factors affecting it, and its general distribution. Part 2 consists of seven chapters describing the characteristic landforms unique to these areas and the processes involved in their formation. Part 3 discusses the special problems encountered by engineers in construction projects including settlements, roads and railways, the oil and gas industry, mining, and the agricultural and forest industries. The three authors represent three countries and three language groups, and together have over 120 years of experience of working in permafrost areas throughout the world. The book contains over 300 illustrations and photographs, and includes an extensive bibliography in order to introduce the interested reader to the large current literature. Finalist of the 2019 PROSE Awards.
