Drugs, Alcohol and Sport Paul Dimeo 2013-09-13 The use of alcohol and drugs seems contradictory to the popular ideal of sport as a healthy moral and physical pursuit, and yet it has been present in sports culture since clubs first became the focus for competitive games and social gatherings. Charting the changing patterns of the use of drugs and alcohol since the nineteenth century, this is a critical history that relates substance consumption and regulation to social relations of power: sports men and women almost revelling in their deviance and leaving the moral agonising to their supposed 'superiors'. In addition, certain substances have become at various times the focus of heightened controversy, raising questions about the symbolism of the body in sport, its uses and behaviours and associated perceptions. These questions are tackled here in a lively discussion on the social construction of drug and alcohol use, ideal as a catalyst for debate or as an informed introduction to the hottest topic in sport today. This book was previously published as a special issue of *Sport in History*.

Sports Endocrinology Michelle P. Warren 2000-05-01 Since the observation in the 19th century that an extract of the suprarenal bodies injected into the circulation caused a rise in blood pressure, the endocrine system has become a major component in our understanding of human physiology. The introduction of radioimmunoassay techniques and the ability to measure minimal amounts of hormones (a term derived from the Greek "to excite") have shown that acute exercise causes a release of a large number of hormones and that chronic exercise may further lead to long-term alterations in endocrine homeostasis. Actually, almost every organ and system in the body is affected by physical activity and exercise, much of it through the endocrine and neuroendocrine system. Investigation of the effect of acute or chronic physical activity on the endocrine system is a complex matter since the stimulus called "exercise" has many components, such as mode, intensity, duration, and others. In addition, several other factors, such as age, gender, training status, body temperature, circadian rhythm, metabolic state, menstrual cycle, and various external conditions as well as psychological factors, can modify the effect of physical activity on hormonal secretion. Moreover, the physiological stimulus of exercise often provokes several and parallel cascades of biochemical and endocrine changes. It is therefore often extremely difficult to distinguish between primary and secondary events and between cause and effect. These limitations will be discussed in Chapter 1.
