The Science of Sailing: A complete guide to the physics of sailing and the naval architecture governing the performance of sailing yachts Peter van Oossanen
2020-01-01 Part 4 of the "Science of Sailing" addresses the phenomena and drag arising from the air-water

interface experienced by sailing craft. The topics that are dealt with are wave causation and its consequences on drag, the properties of regular waves in deep and shallow water, the wave pattern generated by the hull of sailing craft, wave drag, interference of wave systems, running trim and sinkage/rise, breaking waves, spray, wind-generated waves and spectra, motions displayed by sailing yachts, wave-added drag, surfing behaviour, cavitation, and ventilation.

Scientific Applications Of The Connection Machine

(2nd Edition) Horst D Simon
1991-12-16 The Connection Machine is one of the first commercially available machines which allows users to explore massive parallelism for the solution of large scale engineering and scientific applications. The CM2 features up to 64,000 processors. This is parallelism on an unprecedented scale which opens up new areas of computational science. Because of the overwhelming

response to the first edition, a new edition has been prepared. New papers which document recent developments are added, bringing the volume up-to-date.

Residence Time Distributions and Computational Fluid Dynamics to Characterize Dilution Ventilation in a Confined Space Model

Ravi Nabar 1994 [Computational Fluid Dynamics for Mechanical Engineering](#) George Qin 2021-10-18 This textbook presents the basic methods, numerical schemes, and algorithms of computational fluid dynamics (CFD). Readers will learn to compose MATLAB® programs to solve realistic fluid flow problems. Newer research results on the stability and

boundedness of various numerical schemes are incorporated. The book emphasizes large eddy simulation (LES) in the chapter on turbulent flow simulation besides the two-equation models. Volume of fraction (VOF) and level-set methods are the focus of the chapter on two-phase flows. The textbook was written for a first course in computational fluid dynamics (CFD) taken by undergraduate students in a Mechanical Engineering major. Computational Methods for Aerodynamic Design (inverse) and Optimization North Atlantic Treaty Organization. Advisory Group for Aerospace Research and Development.

Fluid Dynamics Panel 1990 The meeting focused on those CFD-based methods which address the problem of design for given aerodynamic characteristics in a direct sense. Examples are inverse methods which provide the detailed geometry required to generate a given pressure distribution and methods utilizing numerical optimization techniques to obtain the geometry that minimizes, subject to constraints, a given aerodynamic objective function such as drag, load distribution, etc.--abs.

Parallel Computational Fluid Dynamics '91 K. G. Reinsch 1992 Parallel CFD is an emerging field at the forefront of computing. It is now used for design and analysis purposes in several aerospace companies.

This book is a collection of articles, describing the state of the art of Parallel Computational Fluid Dynamics. Algorithms and results for realistic applications in both compressible and incompressible flow are described covering shared memory systems as well as MIMD and SIMD architectures. In addition, recommendations are presented for parallelization of large fluid dynamics codes on massively parallel systems. The special issues of load balancing and communication for CFD codes are also addressed.

Computational Fluid Dynamics and Energy Modelling in Buildings Parham A. Mirzaei
2022-11-04 COMPUTATIONAL FLUID DYNAMICS AND ENERGY MODELLING IN BUILDINGS A Comprehensive Overview of the Fundamentals of Heat and Mass Transport Simulation and Energy Performance in Buildings In the first part of Computational Fluid Dynamics and Energy Modelling in Buildings: Fundamentals and

Applications, the author explains the fundamentals of fluid mechanics, thermodynamics, and heat transfer, with a specific focus on their application in buildings. This background knowledge sets the scene to further model heat and mass transport in buildings, with explanations of commonly applied simplifications and assumptions. In the second part, the author elaborates how the fundamentals explained in part 1 can be used to model energy flow in buildings, which is the basis of all commercial and educational building energy simulation tools. An innovative illustrative nodal network concept is introduced to help readers comprehend the basics of conservation laws in buildings. The application of numerical techniques to form dynamic simulation tools are then introduced. In general, understanding these techniques will help readers to identify and justify their choices when working with building energy simulation tools, rather than using default

settings. Detailed airflow information in buildings cannot be obtained in building energy simulation techniques.

Therefore, part three is focused on introducing computational fluid dynamics (CFD) as a detailed modelling technique for airflow in buildings. This part starts with an introduction to the fundamentals of the finite volume method used to solve the governing fluid equations and the related challenges and considerations are discussed. The last chapter of this part covers the solutions to some practical problems of airflow within and around buildings. The key aspect of Computational Fluid Dynamics and Energy Modelling in Buildings: Fundamentals and Applications is that it is tailored for audiences without extensive past experience of numerical methods.

Undergraduate or graduate students in architecture, urban planning, geography, architectural engineering, and other engineering fields, along with building performance and simulation professionals, can

use this book to gain additional clarity on the topics of building energy simulation and computational fluid dynamics.
