Post-transcriptional Control of Gene Expression Orna Resnekov 2013-06-29 Many important cellular processes rely on posttranscriptional control of gene expression. This book describes the mechanisms of gene expression at this level that occur in the cytoplasm of prokaryotes and eukaryotes. Several introductory chapters discuss the general principles of translation and mRNA stability. The interactions of mature mRNA with the translational machinery, the components of mRNA degradation and antisense RNA are surveyed. Subsequent chapters discuss protein folding, transport, modification and degradation. The book is an invaluable source of information for both newcomers and those wishing an overview of the field.

Changes in Eukaryotic Gene Expression in Response to Environmental Stress Burr Atkinson 2012-12-02 Changes in Eukaryotic Gene Expression in Response to Environmental Stress focuses on various aspects of eukaryotic cell's response to heat stress (shock) and other stress stimuli. This book is organized into two major sections, encompassing 17 chapters that reflect the emphasis on research utilizing *Drosophila*, a variety of animal systems, and plants. This book first provides a brief introduction to the organization, sequences, and induction of heat shock proteins and related genes. It then describes the control of transcription during heat shock from the standpoint of molecular biology and evolutionary variations of the mechanisms in organisms with diverse metabolic needs. It goes on to discuss the issue of coordinate and noncoordinate responses of heat shock genes. It presents a model for post-transcriptional regulation on certain aspects of coordinate and noncoordinate regulations. Chapters 6-12 discuss heat shock proteins and genes and the effects of stress on gene expression of sea urchin, avian, and mammalian

cells. The second part of the book focuses on the physiological role of heat shock proteins and genes in plants and fungi. It includes a discussion on experimental problems encountered during studies of the mechanisms of inhibition of photosynthesis by unfavorable environmental conditions. The changes in transcription and translation of specific mRNAs in the developing embryo during heat shock at various temperatures are described. The concluding chapters deal with heat shock response in plants, particularly the response in soybeans and maize, covering both physiological and molecular analyses. Research scientists, clinicians, and agriculturists will greatly benefit from the information presented in this book.

Stochastic Modelling for Systems Biology, Second Edition Darren J. Wilkinson 2011-11-09 Since the first edition of Stochastic Modelling for Systems Biology, there have been many interesting developments in the use of "likelihood-free" methods of Bayesian inference for complex stochastic models. Re-written to reflect this modern perspective, this second edition covers everything necessary for a good appreciation of stochastic kinetic modelling of biological networks in the systems biology context. Keeping with the spirit of the first edition, all of the new theory is presented in a very informal and intuitive manner, keeping the text as accessible as possible to the widest possible readership. New in the Second Edition All examples have been updated to Systems Biology Markup Language Level 3 All code relating to simulation, analysis, and inference for stochastic kinetic models has been re-written and re-structured in a more modular way An ancillary website provides links, resources, errata, and up-to-date information on installation and use of the associated R package More background material on the theory of Markov processes and stochastic differential equations, providing more substance for mathematically inclined readers Discussion of some of the more advanced concepts relating to stochastic kinetic models, such as random time change representations, Kolmogorov equations, Fokker-Planck equations and the linear noise approximation Simple modelling of "extrinsic" and "intrinsic" noise An effective introduction to the area of stochastic modelling in computational systems biology, this new edition adds additional mathematical detail and computational methods that will provide a stronger foundation for the development of more advanced courses in stochastic biological modelling.

Eucaryotic Gene Regulation Richard Axel 2012-12-02 Eukaryotic Gene Regulation covers the aspects and mechanisms of gene regulation of selected eukaryotes, such as yeast, *Drosophila*, and insect. This book is organized into eight parts, encompassing 52 chapters. The majority of the chapters are presented in an experimental manner containing an abstract, methods, results and discussion, and conclusion. This book first gives a short overview of the evolutionary role of interspersion in eukaryotic genes. It then presents considerable chapters on control of gene expression in yeast; gene mutation and isolation; structure and function; and analysis. Part III focuses on genetic and DNA sequence analysis in *Drosophila*. It includes discussions on allelic complementation and transvection, genetic organization, histone gene, and gene transcription. Part IV examines cell lineage; gene expression and sequences; and protein synthesis of insects, sea urchin, and mammalian cells. This is followed by discussions on structure and expression of specific eukaryotic genes from chicken, rat, rabbit, and human. Topics on the transfer of genetic information within and between cells and the structure and function of chromosome are significantly considered in Parts VI and VII. Genes evaluated in these sections include heavy chain immunoglobulin, light chain, beta-globin, and dihydrofolate reductase. Furthermore, this book describes the in vitro transcription and the factors involved; internal organization and mechanism of assembly of nucleosome; and chromatin structure. The concluding section focuses on aspects of viral genome expression including gene regulation, synthesis, processing, and alternative RNA splicing. Research biologists, geneticists, scientists, teachers, and students will greatly benefit from this book.

Transcription Factors in Eukaryotes Athanasios G. Papavassiliou 1997-01-01 Transcription factors are

central to the process of eukaryotic gene control. These proteins influence the basal level of gene expression in a cell and can modulate genetic programs by activating or repressing the transcription of particular genes in a cell-type specific or inducible manner. This book provides a state-of-the-art overview of the wide gamut of cellular and viral transcription factors, with emphasis on structure-function interrelations in the context of the nuclear environment, their modes of action in signal-dependent and tissue-specific gene regulation, and their involvement in various aspects of growth, differentiation and tumorigenesis/antioncogenesis.
