We'll do that in a few minutesafter we learned more about microcontrollers in general and in particulara large and wonderful Arduino family. This chapter will teach you how to be completely perfectready to enter code, phone, and check things with your new hardware friend. Yes, this will doit happened quickly, very quickly; now let's go inside!What is a microcontroller?A microcontroller is an integrated circuit (IC) that contains all the main components of a standardComputer, the following:* Processor* Memories* Edges* Inputs and outputsThe brain processor, the part where all the decisions are made and whathe can count.Memories are often the two spaces where both the internal system and the uselements are active (commonly called Read Only Memory (ROM) and RandomAccess Memory (RAM)).Beginner ArduinoArduino is a pocket-sized computer (also called a "microcontroller") that you can use to control circuits. Works with a foreign name through sensors, lead, engines, speakers ... even the internet; this makes it a flexible platform for many creative projects. Other popular uses include:Structured lighting that reflects responsiveness to music or social media.Robots that use information from sensors to navigate or perform other tasks.Different controls, default and social media for music, games, and more.Connecting real world objects online (twitter is very popular).Anything connected.Automation and prototyping.There are tons of amazing Arduino Projects posted online, here are some of my favorites:Twitter Mood Light with RandomMatrix, a color that changes color depending on what

Arduino is actually a small computer that can connect to electrical circuits. The Arduino Uno is powered by the Atmega 328P chip, which is the largest chip on the board (see photo note in the picture above). This chip is able to perform programs stored in its memory (very limited).We can download applications to the chip via USB using Arduino IDE (download this if you have not already done so). The USB port also enables Arduino. Alternatively, we can power the built-in board using a power jack, in which case we do not need a USB connection.Arduino has a few rows of pins that we can connect wires to. The power pins are labeled in the image above. Arduino has both 3.3V or 5V specifications; In this section we will use the 5V supply, but you can get chips or items that require 3.3V to work, in which case the 3.3V supply will be useful. You will also find some pins marked "GND" in Arduino, these are ground pins (ground the same thing as 0V). Get up to speed on the Arduino board and essential software concepts quicklyLearn basic techniques for reading digital and analog signalsUse Arduino with a variety of popular input devices and sensorsDrive visual displays, generate sound, and control several types of motorsConnect Arduino to wired and wireless networks
